

Collagen Beauty

Featuring Verisol® Bioactive Collagen Peptides™, the only peptides that stimulate collagen synthesis directly at the skin. A refreshing liquid collagen scientifically proven to give you smoother and firmer skin in 28 days.

CanPrev's Collagen Beauty features Verisol® Bioactive Collagen Peptides™.

This unique proprietary form has been carefully formulated, clinically studied and heavily tested.

Not only are these peptides incredibly small, making them **highly bioavailable**, they are keyed with specific sequences that activate and stimulate your skin's fibroblast cells to produce healthy collagen strands.

What does this mean for you?

A liquid collagen that gets you **smoother** and **firmer skin in 28 days**.

Gluten Free

Dairy Free

Soy Free

GMO Free

One serving (10ml) contains

Verisol® Bioactive Collagen Peptides™ 2.5g
Type I and III Hydrolyzed Collagen (bovine) 

500ml Liquid

Explore the research behind these collagen peptides and their unique ability to activate collagen production specifically at the skin.

Unlock collagen for your skin

Just like a key fits into a specific lock, CanPrev's **Collagen Beauty peptides**

were created to **activate** the specific receptors in skin cells known as fibroblast cells. Fibroblast cells are the most common cells responsible for stimulating collagen synthesis (collagen building).

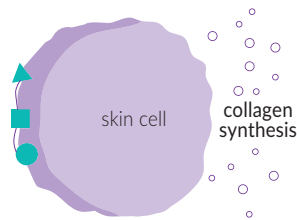

Receptors in fibroblast cells are only activated by specific sequencing of peptides.

These receptors act like locks. Only the correct peptide sequence 'key' will activate the cell's collagen producing engine.

Precise sequencing

Only the right sequencing of peptide keys will 'open the door' or 'turn on collagen synthesis'.

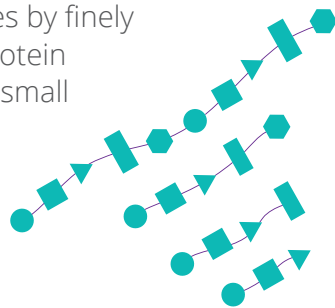

CanPrev Beauty peptides are the **precise sequence** of amino acid chains needed in the skin's fibroblast cells.

How?

We obtain these peptides by finely breaking down whole protein collagen fibres into very small amino acid chains.

These short chains are further sifted and isolated into different bioactive peptides - i.e. different keys.

Finally, we choose the keys that only target skin cells.

Smaller is better

Smaller peptides can be carefully chosen to target collagen production in specific parts of the body, whether it's for muscles, joints, bones or in the skin. That's how we can ensure nearly 100% of the collagen peptides you take are properly applied to parts of the body - and the goals - you want to focus on.

Why is that?

Our bodies can only absorb proteins when they are broken down into small peptides that are two, three, or four amino acid chains in length.

If they are longer, we have to digest these into smaller chunks.

Small amino acid sequences, like the ones in Collagen Beauty, are absorbed whole by our body, without a need to break them down further.

If we choose the right sequences, all of the collagen peptides you absorb will activate collagen synthesis in the part of the body you care about - in this case, the skin!

What happens to peptides that are larger?

They are broken down into smaller random sequences not all of which will activate collagen synthesis where we want it.

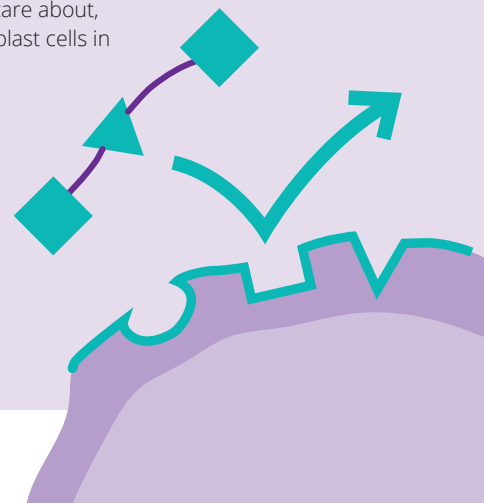

Breaking down large peptides

1. When we consume large peptides with long amino acid sequences, they need to be broken down during digestion.

2. Stomach acid helps to cleave large peptides through a process called hydrolysis.

3. The broken down peptides are able to be absorbed by the body. But the hydrolysis results in random peptide sequences.

4. Not all of these broken down peptides will activate the specific cells we care about, such as the fibroblast cells in the skin.

The longer the amino acid chains, the less effective the collagen production.

Molecular Weight (kD) The molecular weight of a peptide is measured in Kilodaltons (kD)	Amino Acid Length (AA) Peptides joined together create amino acid chains
5 kD	45 AA 
3.6 kD	33 AA 
2 kD	18 AA 
*0.5 kD	3 AA 

*CanPrev's Collagen Beauty peptides.

The right sequence, the right size

CanPrev's Collagen Beauty peptides:

- are the specific sequence of peptide keys that target skin collagen production
- measure in at 0.5 kD equal to only 3 amino acid chains in length
- provide superior bioavailability and effectiveness.

For your skin, this is a beautiful thing!

Research and results

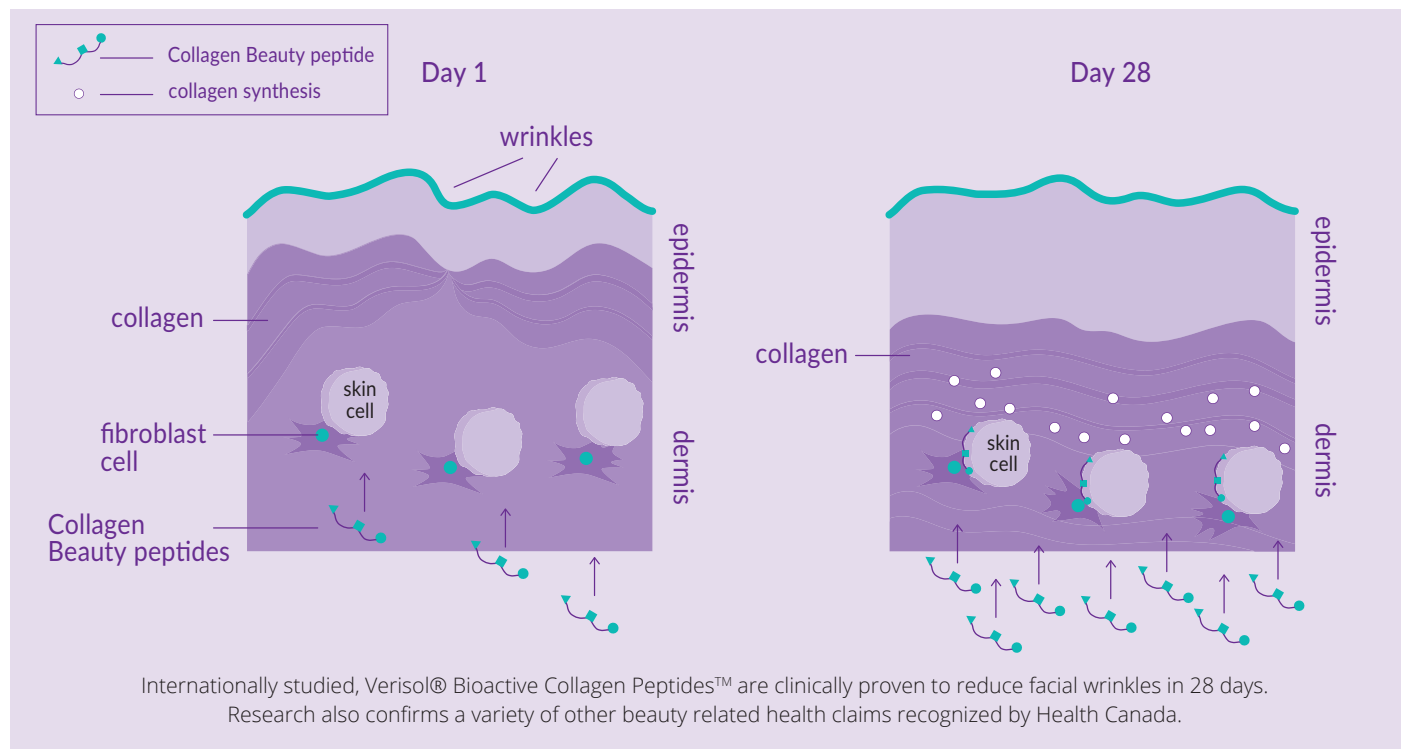

Verisol® Bioactive Collagen Peptides™ have been internationally studied more than leading brands.

Three published research trials support the ability of these peptides to **reduce the appearance of cellulite, improve nail growth, and decrease cracked or chipped nails**, all while increasing the smoothness and firmness of the skin.

Besides reducing wrinkles in 28 days, research for Collagen Beauty peptides supports a wide variety of other beauty claims.

CanPrev's Collagen Beauty helps to...

- Reduce wrinkles in 28 days
- Activate skin collagen production
- Visibly delay skin ageing
- Reduce eye wrinkles
- Increase moisture in skin
- Increase skin elasticity
- Increase skin density
- Smooth and firm skin
- Support cellulite reduction
- Improve nail growth

Beauty begins beneath the surface

Clean, uncomplicated Collagen non-medicinals.

Citric acid: natural pH buffer for a gentle digestive experience.

Potassium sorbate: Natural preservative and antimicrobial. No sodium benzoate. No harsh parabens.

Xylitol, stevia & natural orange flavour: Natural flavours without sugar or sucralose. Now that's sweet!

Beta-carotene: Delicious & natural orange colour. No artificial colours used.

Collagen & Silicon. Better together.

Why? **Both decline as we age.**

Collagen makes up 30% of our total body protein and is the major structural component of our skin. Silicon deficiency affects healthy collagen production.

Together they supply the raw building blocks needed for smoother and firmer looking skin.

Liquid experience for fast-acting convenience.

Delicious taste! So good you won't want to mix it (but if you want to, you can).

Never miss another dose of well-being.

No pills to count. One pour away from nourishing your foundation. That's an easy spoonful to swallow.
